

CONCEALED BRACKET WITH AND WITHOUT HOLES

POST AND BEAM CONSTRUCTIONS

Standard connection designed for optimum strength for post and beam systems. By using SBD self-drilling dowels, a tolerance of up to 46 mm (± 23 mm) along the beam axis can be accommodated to fit installation tolerances.

NEW GEOMETRY

Optimised shape thanks to the new high-strength aluminium alloy EN AW-6082. Reduced weight and easier insertion of SBD self-drilling dowels.

FAST FASTENING

Certified strengths calculated in all directions: vertical, horizontal and axial. Certified fastening with LBS screws and SBD self-drilling dowels.

USA, Canada and more design values available online.

FIELDS OF USE

Concealed beam joints in timber-to-timber, timber-to-concrete or timber-to-steel configurations, suitable for large roofs, floors and post-and-beam constructions. Use also outdoors in non aggressive environments.

Can be applied to:

- glulam, softwood and hardwood
- LVL

FIRE RESISTANCE

The low weight of the steel - aluminium alloy facilitates easy transportation and on-site movements, while guaranteeing a very high strength. Being a concealed joint, it satisfies the fire safety requirements.

SIDE-BY-SIDE INSTALLATION

For high stresses or in the case of wide beams, two brackets can be placed side by side and fastened with long SBD dowels.

ALUMAXI2176	without holes	2176	85 11/16	1

ENGINEERING OPTIMISATION

The new ALUMAXI bracket has been designed using a higher-performance aluminium alloy. This choice made it possible to reduce the thickness of the wing and core, and to optimise the shape of the wing by using a tapered profile. The mechanical characteristics are unchanged despite a 17% weight reduction.

NOTES

⁽¹⁾ The bracket with height H is available pre-cut in the ALUMAXI versions with holes (codes on page 90) or can be obtained from the rod ALUMAXI2176 or ALUMAXI2176L rod.

⁽²⁾ SBD self-drilling dowels $\varnothing 7,5$: $M_{y,k} = 75000$ Nmm.

⁽³⁾ STA smooth dowel $\varnothing 16$: $M_{y,k} = 191000$ Nmm.

⁽⁴⁾ Chemical anchor VIN-FIX according to ETA-20/0363 with threaded rods (type INA) of minimum steel class 5.8 with $h_{ef} = 128$ mm. Install the anchors two at a time, starting from the top, dowelling alternate rows.

For the GENERAL PRINCIPLES of calculation, see page 95.

GENERAL PRINCIPLES

- Resistance values for the fastening system are valid for the calculation examples shown in the table. For different calculation methods, the MyProject software is available free of charge (www.rothoblaas.com).
- The calculation process used a timber characteristic density of $\rho_k = 385 \text{ kg/m}^3$ and C25/30 concrete with a thin reinforcing layer, where edge-distance is not a limiting factor.
- The coefficients k_{mod} and γ_M should be taken according to the current regulations used for the calculation.
- Dimensioning and verification of timber and concrete elements must be carried out separately.
- The following verification shall be satisfied for combined loading:

$$\left(\frac{F_{v,d}}{R_{v,d}}\right)^2 + \left(\frac{F_{lat,d}}{R_{lat,d}}\right)^2 + \left(\frac{F_{ax,d}}{R_{ax,d}}\right)^2 + \left(\frac{F_{up,d}}{R_{up,d}}\right)^2 \leq 1$$

$F_{v,d}$ and $F_{up,d}$ are forces acting in opposite directions. Therefore only one of the forces $F_{v,d}$ and $F_{up,d}$ can act in combination with the forces $F_{ax,d}$ or $F_{lat,d}$.

- The values provided are calculated with a routing in the 10 mm thick timber.
- For configurations for which only the timber-side strength is reported, the aluminium-side overstrength can be assumed.

STRUCTURAL VALUES | F_v | F_{up}

TIMBER-TO-TIMBER

- Characteristic values comply with the EN 1995-1-1:2014 standard in accordance with ETA-09/0361.

- Design values can be obtained from characteristic values as follows:

$$R_{v,d} = \frac{R_{v,k} \cdot k_{mod}}{\gamma_M}$$

$$R_{up,d} = \frac{R_{up,k} \cdot k_{mod}}{\gamma_M}$$

- Shear strengths on columns are calculated considering the effective number of connectors according to ETA-09/0361.
- In some cases the connection shear strength $R_{v,k}$ - $R_{up,k}$ is notably large and may be higher than the secondary beam strength. Particular attention should be paid to the shear check of the reduced timber cross-section at the bracket location.

STRUCTURAL VALUES | F_{lat} | F_{ax}

TIMBER-TO-TIMBER

- Characteristic values comply with the EN 1995-1-1:2014 standard in accordance with ETA-09/0361.
- Design values can be obtained from characteristic values as follows:

$$R_{lat,d} = \min \left\{ \begin{array}{l} \frac{R_{lat,k \text{ alu}}}{\gamma_{M2}} \\ \frac{R_{lat,k \text{ timber}} \cdot k_{mod}}{\gamma_M} \end{array} \right.$$

$$R_{ax,d} = \min \left\{ \begin{array}{l} \frac{R_{ax,k \text{ alu}}}{\gamma_{M2}} \\ \frac{R_{ax,k \text{ timber}} \cdot k_{mod}}{\gamma_M} \end{array} \right.$$

with γ_{M2} partial coefficient of the aluminium.

STRUCTURAL VALUES | F_v

TIMBER-TO-CONCRETE

- Characteristic values are consistent with EN 1995-1-1:2014 and in accordance with ETA-09/0361 and ETA-20/0363..
- Design resistance values can be obtained from the tabulated values as follows:

$$R_{v,d} = \min \left\{ \begin{array}{l} \frac{R_{v,k} \cdot k_{mod}}{\gamma_M} \\ R_{v,d \text{ concrete}} \end{array} \right.$$

- The design values $R_{v,d \text{ concrete}}$ are according to EN 1992:2018 with $\alpha_{sus} = 0.6$.

INTELLECTUAL PROPERTY

- An ALUMAXI model is protected by the Registered Community Design RCD 015032190-0001.

Discover how to design simply,
quickly and intuitively!

MyProject is the practical and reliable software created for professionals who design timber structures: it allows for the design of a broad range of connections, carry out thermo-hygro-metric analysis of opaque components and designing the most appropriate acoustic solution. The program provides detailed instructions and explanatory illustrations for the products installation.

Simplify your work, **generate complete calculation reports** thanks to MyProject.
