

ALUMIDI

CONCEALED BRACKET WITH AND WITHOUT HOLES

FLOORS AND ROOFS

Suitable for medium-sized floors and roofs. It can also be used with inclined beams, thanks to the certified and calculated strengths in all directions.

NEW LONG VERSION

The 2200 mm long version is now also available with holes. The possibility of cutting every 40 mm allows brackets to be cut to the most suitable size.

TIMBER, CONCRETE AND STEEL

Optimal hole spacing for joints on timber (nails or screws), on reinforced concrete (chemical anchors) and on steel (bolts).

USA, Canada and more design values available online.

FIELDS OF USE

Concealed joint for beams in timber-to-timber or timber-to-concrete configuration, suitable for roofs, floors and medium-sized post-and-beam constructions. Use also outdoors in non aggressive environments.

Can be applied to:

- solid timber softwood and hardwood
- glulam, LVL

INVISIBLE

The concealed connection provides a satisfying appearance to the joint and fulfils the fire safety requirements. The notch where the first hole is located, facilitates the introduction of the secondary beam from the top.

UNEVEN SURFACES

For applications on concrete or other uneven surfaces the self-drilling dowels allow a greater installation tolerance when fastening the timber element.

NOTES

(1) The bracket with height H is available pre-drilled in the ALUMIDI versions without holes, ALUMIDI with holes and ALUMIDI with notch (codes on page 80) or can be obtained from the ALUMIDI2200 or ALUMIDI2200L rods.

(2) SBD self-drilling dowels $\varnothing 7,5$: $M_{y,k} = 75000 \text{ Nmm}$.

(3) STA smooth dowels $\varnothing 12$: $M_{y,k} = 69100 \text{ Nmm}$.

(4) Chemical anchor VIN-FIX according to ETA-20/0363 with threaded rods (type INA) of minimum steel class 5.8 with $h = 93 \text{ mm}$. Install the anchors two at a time, starting from the top, dowelling alternate rows.

For the GENERAL PRINCIPLES of calculation, see page 87.

APPLICATION EXAMPLES

primary inclined beam

secondary inclined beam

fastening on CLT wall

CLT wall-CLT floor joint

GENERAL PRINCIPLES

- Resistance values for the fastening system are valid for the calculation examples shown in the table. For different calculation methods, the MyProject software is available free of charge (www.rothoblaas.com).
- The calculation process used a timber characteristic density of $\rho_k = 385 \text{ kg/m}^3$ and C25/30 concrete with a thin reinforcing layer, where edge-distance is not a limiting factor.
- The coefficients k_{mod} and γ_M should be taken according to the current regulations used for the calculation.
- Dimensioning and verification of timber and concrete elements must be carried out separately.
- The following verification shall be satisfied for combined loading:

$$\left(\frac{F_{v,d}}{R_{v,d}}\right)^2 + \left(\frac{F_{lat,d}}{R_{lat,d}}\right)^2 + \left(\frac{F_{ax,d}}{R_{ax,d}}\right)^2 + \left(\frac{F_{up,d}}{R_{up,d}}\right)^2 \leq 1$$

$F_{v,d}$ and $F_{up,d}$ are forces acting in opposite directions. Therefore only one of the forces $F_{v,d}$ and $F_{up,d}$ can act in combination with the forces $F_{ax,d}$ or $F_{lat,d}$.

- The values provided are calculated with a routing in the 8 mm thick timber.
- For configurations for which only the timber-side strength is reported, the aluminium-side overstrength can be assumed.

STRUCTURAL VALUES | F_v | F_{up}

TIMBER-TO-TIMBER

- Characteristic values are consistent with EN 1995-1-1:2014, in accordance with ETA-09/0361 and ETA-22/0002, and evaluated with Rothoblaas experimental method.
- Design values can be obtained from characteristic values as follows:

$$R_{v,d} = \frac{R_{v,k} \cdot k_{mod}}{\gamma_M}$$

$$R_{up,d} = \frac{R_{up,k} \cdot k_{mod}}{\gamma_M}$$

- In some cases the connection shear strength $R_{v,k}$ - $R_{up,k}$ is notably large and may be higher than the secondary beam strength. Particular attention should be paid to the shear check of the reduced timber cross-section at the bracket location.

STRUCTURAL VALUES | Flat | F_{ax}

TIMBER-TO-TIMBER

- Characteristic values comply with the EN 1995-1-1:2014 standard in accordance with ETA-09/0361.
- Design values can be obtained from characteristic values as follows:

$$R_{lat,d} = \min \left\{ \begin{array}{l} \frac{R_{lat,k,alu}}{\gamma_{M2}} \\ \frac{R_{lat,k,timber} \cdot k_{mod}}{\gamma_M} \end{array} \right.$$

$$R_{ax,d} = \min \left\{ \begin{array}{l} \frac{R_{ax,k,alu}}{\gamma_{M2}} \\ \frac{R_{ax,k,timber} \cdot k_{mod}}{\gamma_M} \end{array} \right.$$

with γ_{M2} partial coefficient of the aluminium.

STRUCTURAL VALUES | F_v

TIMBER-TO-CONCRETE

- Characteristic values are consistent with EN 1995-1-1:2014 and in accordance with ETA-09/0361 and ETA-20/0363..
- Design resistance values can be obtained from the tabulated values as follows:

$$R_{v,d} = \min \left\{ \begin{array}{l} \frac{R_{v,k} \cdot k_{mod}}{\gamma_M} \\ R_{v,d,concrete} \end{array} \right.$$

- The design values $R_{v,d,concrete}$ are according to EN 1992:2018 with $\alpha_{sus} = 0.6$.

INTELLECTUAL PROPERTY

- An ALUMIDI model is protected by the Registered Community Design RCD 008254353-0001.
